(57) Abstract			
<p>The present invention relates to novel 5,6-dihydropyrone derivatives and related structures which potently inhibit the HIV aspartyl protease blocking HIV infectivity. The 5,6-dihydropyrone derivatives are useful in the development of therapies for the treatment of bacterial and viral infections and diseases, including AIDS. The present invention is also directed to methods of synthesis of multifunctionalized 5,6-dihydropyrone and of related structures.</p>

**5,6-DIHYDROPYRONE DERIVATIVES AS PROTEASE INHIBITORS AND  
ANTIVIRAL AGENTS**

**1. FIELD OF THE INVENTION**

5       The present invention relates to 5,6-dihydropyrone derivatives that are inhibitors of aspartyl proteases, in particular the aspartyl proteases found in retroviruses including Human Immunodeficiency Virus (HIV). The 5,6-dihydropyrones are expected to have utility as antiviral 10 agents, for the treatment of infection caused by HIV or other retroviruses employing aspartyl proteases, and to be useful in the treatment of diseases caused by the retroviruses, including AIDS.

**15      2. BACKGROUND OF THE INVENTION**

Acquired Immunodeficiency Syndrome (AIDS) was coined in 1982 to describe the clinical manifestations of immunodeficiency. The etiological agent of AIDS was later associated with a retrovirus, Human Immunodeficiency Virus 20 (HIV), from the lentivirus subfamily. At least two infectious strains of HIV have been identified, HIV-1 and HIV-2. Here, HIV will be used as a general term describing all strains and mutants of the Human Immunodeficiency Virus. The detailed study of HIV has given rise to many approaches to antiviral 25 drug development including inhibition of the viral aspartyl protease (D. Richman, *Control of Virus Diseases*, 45th Symposium of the Society for General Microbiology, 261-313 (1990)).

Aspartyl proteases have been found in many retroviruses 30 including the Feline Immunodeficiency Virus (FIV), the Myeloblastosis Associated Virus (MAV), HIV, and the Rous Sarcoma Virus (RSV) [H. Toh et al. *Nature*, 315: 691 (1985); J. Kay, B. M. Dunn, *Biochim. Biophys. Acta*, 1: 1048 (1990); C. Cameron, *J. Biological Chem.*, 168: 11711-720 (1993)]. Since 35 there are structural similarities among the known retroviral proteases, compounds which inhibit the HIV protease may well inhibit other retroviral proteases.

- 2 -

HIV aspartyl protease is responsible for post-translational processing of viral precursor polyproteins such as *pol* and *gag*. (M. Graves, *Structure and Function of the Aspartic Proteases*, 395-405 (1991)). Cleavage of these 5 polyproteins is essential for maturation of the virus, since the proteolytic activity necessary for polyprotein processing cannot be provided by host cellular enzymes. An important finding has been that viruses which lack this protease, or contain a mutant which is a defective protease, lack 10 infectivity [C. Ping et al., *J. Virol.*, 63: 2550-556 (1989) and N. Kohl et al., *Proc. Nati. Acad. Sci. USA*, 85: 4686-90 (1987)]. Thus, a selective HIV protease inhibitor has been shown to inhibit viral spread and the production of cytopathic effects in cultures of acutely infected cells (J. C. Craig, 15 *Antiviral Research*, 16: 295-305 (1991)). For this reason, inhibition of HIV protease is believed to be a viable approach to antiviral therapy.

HIV protease inhibitors have been extensively reviewed (see for example A. Tomasselli et al., *Chimica Oggi*, 6-27 20 (1991) and T. Meek, *J. Enzyme Inhibition* 6: 65-98 (1992)). However, the majority of these inhibitors are peptides and thus unsuitable as drugs, due to the well known pharmacological deficiencies exhibited by most peptide drugs (biliary excretion, low bioavailability and stability in 25 physiological milieu, etc.) Nonpeptidic inhibitors of HIV protease are thus very important, since these may lead to useful therapeutic agents.

Hei 3-227923 claimed coumarins with anti-HIV activity. However, only 4-hydroxycoumarin was specifically described 30 without discussion of mechanism of action.

World Patent 89/07939 claimed eight coumarin derivatives as HIV reverse transcriptase inhibitors with potential antiviral activity. These derivatives are hexachlorocoumarin, 7-acetoxycoumarin, and the structures shown below.

R=H, R'=Cl; R=H, R'=CF<sub>3</sub>; R=R'=Cl

Warfarin (3-( $\alpha$ -acetonylbenzyl)-4-hydroxycoumarin), shown below, was reported by R. Nagorny et al. in AIDS 7: 129-130 (1993) as inhibiting cell-free and cell-mediated HIV infection. However, Warfarin was the only analog pyrone studied and its mechanism of action in HIV inhibition was not specified.

20

Selected flavones, structurally different from the 5,6-dihydropyrone of the present invention, were reported by Fairli et al., (Biochem. Biophys. Res. Comm., 188: 631-637, (1992)) to be inhibitors of HIV-1 protease. These compounds are shown below.

10 United States Patent Number 3,206,476 describes several pyrones, specifically 3-substituted-4-hydroxy-6-aryl-2-pyrone derivatives, as antihypertensive agents. However, the range of substituents at the 3-position of these heterocycles is limited to halo and amino groups and alkanoylamino  
15 derivatives.

United States Patent Number 3,818,046 describes several pyrone derivatives, specifically 4-hydroxypyrones with sulfur-containing carbon chains at the 3-position, as growth stutters and antimicrobial agents. These pyrones are substituted as  
20 follows: R = Me; M = H or alkali metal; and R' = H, alkyl, phenyl, halophenyl, nitrophenyl, lower alkylphenyl, benzyl, phenethyl, naphthylmethyl, halobenzyl, lower alkylbenzyl, nitrobenzyl, propargyl, allyl, cyclohexyl, lower alkyl, lower thioalkyl, or adamantyl; and n = 0 to 2.

A process for preparing the pyrones shown above is claimed in United States Patent No. 3,931,235.

EP 278742 describes several cyclic 2-benzoyl-1,3-diones with herbicidal activity. All of these compounds possess 3-5 benzoyl substituents. Their structures, in the keto tautomeric forms, are shown below:

### 3. SUMMARY OF THE INVENTION

The present invention is based in great part on the extraordinary discovery of the inventors that novel 5,6-dihydropyrone derivatives and related compounds, selected from a broad spectrum of tailored molecular structures, potently inhibit the HIV aspartyl protease blocking infection by HIV. The present invention is also based on the insights of the applicants regarding the mechanism of action of antiviral drugs, especially as revealed by their studies on structure-activity relationships characteristic of anti-HIV compounds that include 5,6-dihydropyrone derivatives.

The invented 5,6-dihydropyrone are expected to be extremely useful in the development of treatments for infections caused by viruses, especially by retroviruses that rely on aspartyl protease activities for replication and infectivity. One such retrovirus is HIV. For this reason, the antiviral 5,6-dihydropyrone are also expected to be very useful in the treatment of diseases and syndromes associated with viral pathogens. One such syndrome is AIDS.

Efficient syntheses of the biologically active 5,6-dihydropyrone involving either de novo assemblies of the 5,6-dihydropyrene nucleus or modifications of suitably

- 6 -

functionalized 5,6-dihydropyrones, are disclosed. Furthermore, many working examples outlining the preparation of specific 5,6-dihydropyrones whose structures contain the desired functional groups in proper geometric arrangements are given.

The testing of specific 5,6-dihydropyrones as inhibitors of the HIV aspartyl protease, based on the study of the hydrolysis of an undecapeptide enzyme substrate, and the testing of the 5,6-dihydropyrones as inhibitors of viral growth and infectivity, based on the study of infection of H9 cell lines by the HIV-1<sub>IIIB</sub> strain, are also disclosed. Striking enzyme inhibitions, at nanomolar levels, with corresponding anti-HIV activities were observed.

The present inventors contemplate the preparation of pharmaceutically useful antiviral compositions comprising one or more of the invented 5,6-dihydropyrones and related compounds and a pharmaceutically acceptable carrier. They also contemplate the use of these compositions, alone or in combination with other antiviral treatments, in the treatment of infections and diseases caused by retroviruses, including AIDS.

The present inventors contemplate the preparation of pharmaceutically useful antibacterial compositions comprising one or more of the invented 5,6 dihydropyrones and related compounds and a pharmaceutically acceptable carrier.

The present invention relates to compounds or the pharmaceutically acceptable salts thereof of formula 1, shown below,

#### 4. DETAILED DESCRIPTION OF THE INVENTION

Here, the term "alkyl" means a straight or branched hydrocarbon radical having from 1 to 12 carbon atoms unless otherwise specified and includes, for example, methyl, ethyl, n-propyl, isopropyl, n-butyl, sec-butyl, isobutyl, tert-butyl, n-pentyl, n-hexyl, n-heptyl, n-octyl, n-nonyl, n-decyl, undecyl, and dodecyl. The alkyl groups may contain one or more sites of unsaturation such as double or triple carbon-carbon bonds. The alkyl group is unsubstituted or substituted by from 1 to 3 substituents selected from alkyl, alkoxy, thioalkoxy all as defined herein, hydroxy, thiol, nitro, halogen, amino, formyl, carboxyl, nitrile, -NH-CO-R, -CO-NH-, -CO<sub>2</sub>R, -COR, aryl, or heteroaryl wherein alkyl (R), aryl, and heteroaryl are defined as herein.

The term "cycloalkyl" means a hydrocarbon ring which contains from 3 to 12 carbon atoms unless otherwise specified, for example, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, 35 and adamantyl. Where possible, the cycloalkyl group may contain double bonds. The cycloalkyl ring may be unsubstituted or substituted by from 1 to 3 substituents

- 25 -

selected alkyl, alkoxy, thioalkoxy all as defined herein, hydroxy, thiol, nitro, halogen, amino, formyl, carboxyl, nitrile, -NH-CO-R, -CO-NHR-, -CO<sub>2</sub>R, -COR, aryl, or heteroaryl wherein alkyl (R), aryl, and heteroaryl are defined as herein.

5       The term alkylcycloalkyl means a cycloalkyl group as defined above attached directly to an alkyl group as defined above.

The terms "alkoxy" and "thioalkoxy" are O-alkyl or S-alkyl as defined above for alkyl.

10      The term spirocycle refers to a carbocyclic or heterocyclic ring whose ends meet at a single carbon in a chain or another ring.

The term "aryl" means an aromatic radical which is a phenyl group, a benzyl group, a naphthyl group, a biphenyl 15 group, a pyrenyl group, an anthracenyl group, a fluarenyl group or a fused ring resulting from any two of phenyl, naphthyl, and a 5- or 6- membered ring containing from 0 to 3 heteroatoms selected from quinolones, isoquinolones, indoles, indanes, benzofurans, benzothiophenes, benzoxazoles, 20 benzothiazoles, benzisoxazoles, coumarins, benzimidazoles and the like, unsubstituted or substituted by 1 to 3 substituents selected from alkyl as defined above, alkoxy as defined above, thioalkoxy as defined above, hydroxy, thiol, nitro, halogen, amino, formyl, carboxy, nitrile, -NHCOR, -CONHR, -CO<sub>2</sub>R, -COR, 25 aryl, or heteroaryl wherein alkyl (R), aryl, and heteroaryl are defined as above.

The terms "heteroaryl" and "heterocycle", represented by an "Ar", mean a heterocyclic radical which is 2- or 3-thienyl, 2- or 3-furanyl, 2- or 3-pyrrolyl, 2-, 4-, or 5-imidazolyl, 3- 30 , 4-, or 5-pyrazolyl, 2-, 4-, or 5-thiazolyl, 3-, 4-, or 5-isothiazolyl, 2-, 4-, or 5-oxazolyl, 3-, 4-, or 5-isaxazolyl, 3- or 5- 1,2,4-triazolyl, 4- or 5- 1,2,3-triazolyl, tetrazolyl, 2-, 3-, or 4-pyridinyl, 3-, 4-, or 5-pyridazinyl, 2-pyrazinyl, 2-, 4-, or 5-pyrimidinyl, 2-, 3-, 4-, 5-, 6-, 7-, 35 or 8-quinolinyl, 1-, 3-, 4-, 5-, 6-, 7-, or 8-isoquinolinyl, 2-, 3-, 4-, 5-, 6-, or 7-indolyl, 2-, 3-, 4-, 5-, 6-, or 7-benzo[b]thienyl, 2-, 4-, 5-, 6-, or 7-benzoxazolyl, 2-, 4-, 5-

- 26 -

, 6-, or 7-benzimidazolyl, 2-, 4-, 5-, 6-, or 7-benzothiazolyl, 1- or 2-piperazinyl, 2-, 3-, or 4-morpholinyl, 2-, 3-, or 4-thiomorpholinyl, 1-, 2-, or 3-pyrrolidinyl, 2- or 3-tetrahydrofuranyl, 2-, 3-, or 4-tetrahydropyranyl, 2- 3-, or 5 4-piperidinyl, 1-, 2-, 4-, 5-, or 6-tetrahydropyrimidinyl, 2-dioxolinyl, 2-, 4-, or 5-imidazolidinyl, 1-, 2-, 3-, 4-, 5-, 6-, or 7-indolinyl, unsubstituted or substituted by 1 to 2 substituents selected from alkyl as defined above, aryl as defined above, alkoxy as defined above, thioalkoxy as defined 10 above, hydroxy, thiol, nitro, halogen, formyl, amino, carboxyl, nitrile, -NHCOR, -CO<sub>2</sub>R, -COR, wherein alkyl is as defined above or phenyl.

"Halogen" is fluorine, chlorine, bromine or iodine.

Some of the compounds of Formula 1 are capable of further 15 forming pharmaceutically acceptable acid-addition and/or base salts. All of these forms are within the scope of the present invention.

Pharmaceutically acceptable acid addition salts of the compounds of Formula 1 include salts derived from nontoxic 20 inorganic acids such as hydrochloric, nitric, phosphoric, sulfuric, hydrobromic, hydriodic, hydrofluoric, phosphorous, and the like, as well as the salts derived from nontoxic organic acids, such as aliphatic mono- and dicarboxylic acids, phenyl-substituted alkanoic acids, hydroxy alkanoic acids, 25 alkanedioic acids, aromatic acids, aliphatic and aromatic sulfonic acids, etc. Such salts thus include sulfate, pyrosulfate, bisulfate, sulfite, bisulfite, nitrate, phosphate, monohydrogenphosphate, dihydrogenphosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, 30 acetate, trifluoroacetate, propionate, caprylate, isobutyrate, oxalate, malonate, succinates suberate, sebacate, fumarate, maleate, mandelate, benzoate, chlorobenzoate, methylbenzoate, dinitrobenzoate, phthalate, benzensulfonate, toluenesulfonate, phenylacetate, citrate, lactate, maleate, 35 tartrate, methanesulfonate, and the like. Also contemplated are salts of amino acids such as arginate and the like and gluconate, galacturonate (see, for example, Berge, S.M., et

- 27 -

al., "Pharmaceutical Salts," *Journal of Pharmaceutical Science*, 66: 1-19 (1977).

The acid addition salt of said basic compounds are prepared by contacting the free base form with a sufficient amount of the desired acid to produce the salt in the conventional manner.

Pharmaceutically acceptable base addition salts are formed with metals or amines, such as alkali and alkaline earth metals or organic amines. Examples of metals used as cations are sodium, potassium, magnesium, calcium, and the like. Examples of suitable amines are N,N'-dibenzylethylenediamine, chloroprocaine, choline, diethanolamine, dicyclohexylamine, ethylenediamine, N-methylglucamine, and procaine (see, for example, Berge, S.M., et al., "Pharmaceutical Salts," *Journal of Pharmaceutical Science*, 66: 1-19 (1977)).

The base addition salts of said acidic compounds are prepared by contacting the free acid form with a sufficient amount of the desired base to produce the salt in the conventional manner.

Certain of the compounds of the present invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, the solvated forms, including hydrated forms, are equivalent to unsolvated forms and are intended to be encompassed within the scope of the present invention.

Certain of the compounds of the present invention possess one or more chiral centers and each center may exist in the R(D) or S(L) configuration. The present invention includes all enantiomeric and epimeric forms as well as the appropriate mixtures thereof.

The compounds of the present invention can be prepared and administered in a wide variety of oral and parenteral dosage forms. Thus, the compounds of the present invention can be administered by injection, that is, intravenously, intramuscularly, intracutaneously, subcutaneously, intraduodenally, or intraperitoneally. Also, the compounds of

- 28 -

the present invention can be administered by inhalation, for example, intranasally. Additionally, the compounds of the present invention can be administered transdermally. It will be obvious to those skilled in the art that the following 5 dosage forms may comprise as the active component, either a compound of Formula 1 or a corresponding pharmaceutically acceptable salt of a compound of Formula 1.

For preparing pharmaceutical compositions from the compounds of the present invention, pharmaceutically 10 acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, pills, capsules, cachets, suppositories, and dispersible granules. A solid carrier can be one or more substances which may also act as diluents, flavoring agents, binders, preservatives, tablet 15 disintegrating agents, or an encapsulating material.

In powders, the carrier is a finely divided solid which is in a mixture with the finely divided active component.

In tablets, the active component is mixed with the carrier having the necessary binding properties in suitable 20 proportions and compacted in the shape and size desired.

The powders and tablets preferably contain from five or ten to about seventy percent of the active compound. Suitable carriers are magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, 25 methylcellulose, sodium carboxymethylcellulose, a low melting wax, cocoa butter, and the like. The term "preparation" is intended to include the formulation of the active compound with encapsulating material as a carrier providing a capsule in which the active component with or without other carriers, 30 is surrounded by a carrier, which is thus in association with it. Similarly, cachets and lozenges are included. Tablets, powders, capsules, pills, cachets, and lozenges can be used as solid dosage forms suitable for oral administration.

For preparing suppositories, a low melting wax, such as a 35 mixture of fatty acid glycerides or cocoa butter, is first melted and the active component is dispersed homogeneously therein, as by stirring. The molten homogenous mixture is

- 29 -

then poured into convenient sized molds, allowed to cool, and thereby to solidify.

Liquid form preparations include solutions, suspensions, and emulsions, for example, water or water propylene glycol 5 solutions. For parenteral injection liquid preparations can be formulated in solution in aqueous polyethylene glycol solution.

Aqueous solutions suitable for oral use can be prepared by dissolving the active component in water and adding 10 suitable colorants, flavors, stabilizing and thickening agents as desired.

Aqueous suspensions suitable for oral use can be made by dispersing the finely divided active component in water with viscous material, such as natural or, synthetic gums, resins, 15 methylcellulose, sodium carboxymethylcellulose, and other well-known suspending agents.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for oral administration. Such liquid forms 20 include solutions, suspensions, and emulsions. These preparations may contain, in addition to the active component, colorants, flavors, stabilizers, buffers, artificial and natural sweeteners, dispersants, thickeners, solubilizing agents, and the like.

25 The pharmaceutical preparation is preferably in unit dosage form. In such form the preparation is divided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of 30 preparation, such as packeted tablets, capsules, and powders in vials or ampoules. Also, the unit dosage form can be a capsules, tablet, cachet, or lozenge itself, or it can be the appropriate number of any of these in packaged form.

The quantity of active component in a unit dose 35 preparation may be varied or adjusted from 0.1 mg to 100 mg preferably 0.5 mg to 100 mg according to the particular application and the potency of the active component. The

- 30 -

composition can, if desired, also contain other compatible therapeutic agents.

In therapeutic use as antagonists of a retroviral protease, as agents for the treatment of infections caused by a retrovirus including HIV, or as agents for the treatment of diseases due to AIDS, the compounds utilized in the pharmaceutical method of this invention are administered at the initial dosage of about 0.01 mg to about 100 mg/kg daily. A daily dose range of about 0.01 mg to about 10 mg/kg is preferred. The dosages, however, may be varied depending upon the requirements of the patient, the severity of the condition being treated, the compound being employed. Determination of the proper dosage for a particular situation is within the skill of the art. Generally, treatment is initiated with smaller dosages which are less than the optimum dose of the compound. Thereafter, the dosage is increased by small increments until the optimum effect under the circumstances is reached. For convenience, the total daily dosage may be divided and administered in portions during the day, if desired.

#### 4.1 General Synthetic Approaches to 5,6-Dihydropyrone Derivatives

Scheme I, shown below, illustrates the preparation of substituted dihydropyrones III.

- 31 -

## SCHEME I

**15****E = alkyl, thioalkyl**

Methyl acetoacetate (**I**) is treated sequentially with a metal hydride, preferably sodium hydride, in THF or ether at -20 °C to +10 °C, and with a stronger base, usually n-BuLi, in a solvent such as THF or ether at -20 °C to +10 °C, producing **20** the dianion. The reaction mixture is quenched with an appropriately substituted aldehyde or ketone, allowed to react for an additional 15 minutes to 24 hours, and finally worked up, furnishing the  $\beta$ -keto lactone (dihydropyrone) **II**. Compound **II** is elaborated into target pyrones **III** via **25** treatment with a suitable electrophile, such as a thiotosylate, an alkyl halide or the like, in ethanol or DMF solution containing an inert base such as triethylamine and/or sodium bicarbonate at 25 °C to 80 °C.

For purposes of the above and other syntheses of the **30** compounds of the present invention, reactive functional groups present in starting materials, reaction intermediates, or reaction products may be protected during chemical reactions using protecting groups which render the reactive functional groups substantially inert to the reaction conditions. (See **35** for example, *Protective Groups in Organic Synthesis*, 2 ed., T. W. Green and P. G. Wuts, John Wiley & Sons, New York, NY 1991). Thus, for example, protecting groups such as the

- 32 -

following may be utilized to protect suitable amino, hydroxyl, and other groups of related reactivity: carboxylic acyl groups, such as formyl, acetyl, trifluoroacetyl; alkoxy carbonyl groups, such as ethoxycarbonyl, *t*-  
5 *butoxycarbonyl* (BOC),  $\beta,\beta,\beta$ -trichloroethoxycarbonyl (TCEC),  $\beta$ -iodoethoxycarbonyl; aryloxycarbonyl groups, such as benzyloxycarbonyl, *p*-methoxybenzyloxycarbonyl, phenoxy carbonyl; trialkyl silyl groups, such as trimethylsilyl and *t*-butyldimethylsilyl (TBDMS); and groups such as trityl,  
10 tetrahydropyranyl, vinyloxycarbonyl, *o*-nitrophenylsulfenyl, diphenylphosphinyl, *p*-toluenesulfonyl, and benzyl, may all be utilized. The protecting group may be removed, after completion of the synthetic reaction of interest, by procedures known to those skilled in the art. For example,  
15 the BOC group may be removed by acidolysis, the trityl group by hydrogenolysis, TBDMS by treatment with fluoride ions, and TCEC by treatment with zinc.

Scheme II describes an alternate synthesis of dihydropyrones which are substituted at C-3.

$\text{Y} = \text{CH}_2, \text{S}, \text{or O}$   
 $\text{R}_4 = \text{unsubstituted or substituted alkyl or aryl}$   
 $\text{R} = \text{alkyl}$

25

35

- 34 -

The acetoacetate I is treated with a base, such as sodium hydride or sodium ethoxide, in a suitable solvent such as THF, ether, or alcohol at -20 °C to 10 °C, and the resulting anion 5 is quenched with an appropriately substituted alkyl or benzyl halide, usually the bromide or iodide, to give ketoester V (Y = CH<sub>2</sub>). Alternatively, chloroacetoacetate IV is reacted with a thiol, preferably in the presence of a suitable base such as triethylamine, piperidine, or pyridine, in a suitable solvent 10 such as dichloromethane, at -10 °C to +25 °C, affording ketoester V (Y = S) (see Z. Yoshida et al., *Tetrahedron* 26: 2987 (1970)). The requisite thiols can be prepared from the corresponding phenol via the Newman-Kwart rearrangement (see, for example, H. Kwart and H. Omura, *J. Amer. Chem. Soc.* 93: 15 7250 (1971); M. S. Newman and F. W. Hetzel, *Org. Syn. Coll.* Vol. VI: 824 (1988); M. S. Newman and H. A. Karnes, *J. Org. Chem.* 31: 3980 (1966)) or from the corresponding iodobenzene via a nucleophilic displacement with thiourea in the presence of a nickel catalyst (K. Takagi, *Chem. Letters*, 1307 (1985)). 20 Similarly, reaction of IV with an alkoxide in a suitable solvent such as benzene, DMF, or mixtures of THF and HMPA, at -10 °C to 25 °C, yields acetoacetate V (Y = O) (see T. Sasaki et al., *Tetrahedron* 38: 85 (1982)). Intermediate V is subsequently elaborated into dihydropyrone VI using the 25 general procedure outlined in Scheme I above.

Analogs possessing amino substituents at the 3-position can be prepared as shown in Scheme III.

- 35 -

## SCHEME III

Ester VII is treated with a suitable base, such as lithium diisopropylamide, in a suitable solvent such as THF or ether, at -78 °C to 0 °C, and the resulting anion is reacted with an appropriately substituted acylating agent such as ester VIII, producing ketoester IX. Cyclization of IX by e.g. treatment with a suitable base such as sodium hydroxide or sodium alkoxide yields desired dihydropyrones X.

Any of the 4-hydroxy-2H-pyran-2-ones such as III, VI, or X can be constructed to contain an appropriate leaving group (such as halogen, acetate, tosylate, etc.) in one of the R<sub>1</sub> or R<sub>2</sub> substituents. Such leaving groups can be displaced by primary or secondary amines to further embellish the R<sub>1</sub> or R<sub>2</sub> substituents. Such displacement would be carried out in alcohol or DMF or DMSO at -10° to 125°C. Likewise, if R<sub>1</sub> or

- 36 -

R<sub>2</sub> contain a carboxylic acid related group, then further chemistry on that group would further embellish the R<sub>1</sub> or R<sub>2</sub> substituents. Such reactions would include esterification or amide formation using methods well known in the art.

- 5 Furthermore, 4-hydroxy-2(1H)-pyridinones such as XI, shown below, are known in the art (e.g. see M.J. Ashton et al., *Heterocycles* 28:(2) 1015 (1989)), and can be converted to desired protease inhibitors and antiviral agents analogous to the 5,6-dihydropyrones by using reactions similar to that used  
10 for conversion of II → III shown in Scheme I above.

Substituted 1,3-cyclohexandiones can be prepared as described by Werbel (see *J. Med. Chem.* 35: 3429-47 (1992) and references cited therein). The 1,3-cyclohexandiones can be converted to substituted analogues using reactions similar to  
25 those used for conversions II → III.

Tetrahydro(thio)pyran-2,4-dione derivatives can be prepared as described in United States Patent 4,842,638 and references cited therein. The tetrahydro(thio)pyran-2,4-diones can be converted to various substituted analogues using  
30 reactions similar to those used for conversions of II → III.

Derivatives containing a thio moiety at the 3-position can also be prepared as shown in Scheme IV:

## SCHEME IV

20         Dihydropyronone II is treated with a suitable brominating agent, such as N-bromosuccinimide, in a suitable solvent, such as t-butanol, for 1 to 18 hours. The resulting bromo intermediate XII is reacted with a thiol, usually in the presence of an appropriate base such as pyridine or  
 25         piperidine, in a suitable solvent such as dichloromethane at 0°C to +25°C to afford desired product XIII.

An alternate synthesis of derivatives containing a carbon substituent at the 3-position is shown in Scheme V.

## SCHEME V

**20** The dihydropyranone II is reacted with a suitable acid chloride, and the product is rearranged to give intermediate XV according to procedures outlined in U.S. Patent 4,842,638 (1989). The keto group of XV is reduced to the methylene with an appropriate reducing agent, such as sodium cyanoborohydride  
**25** or hydrogen in the presence of a catalyst, to afford compound XVI.

**30** In Scheme VI, an optional method for preparing certain 4-hydroxy-2H-pyran-2-ones (such as III or VI) with complex amide containing side chains as R<sub>1</sub> or R<sub>2</sub> is shown.

## SCHEME VI

The prerequisite acid XVII prepared by literature conditions is cyclized to the lactone XVIII in DMF and dichloromethane at temperatures of 0 to 75°C. The lactone is ring opened by the appropriately substituted amine either neat or in solvents such as toluene, at 75 - 110°C to produce ketone amide XIX. This amide XIX is treated with the dianion as described in Scheme I to produce the lactone XX which is identical to II where R<sub>1</sub> is equal to the new amide containing chain. XX can be converted to the target compounds using conditions described in Scheme I.

The compounds of the present invention can exist in their tautomeric forms, i.e. the enol and keto forms shown in Scheme I. Both such forms as well as their mixtures are preferred aspects of the instant invention.

The substituted phenylpropiophenones were prepared by hydrogenation of the corresponding chalcones in tetrahydrofuran with 5% Pd on BaSO<sub>4</sub> as catalyst.

The chalcones were prepared according to Kohler and Chadwell Org. Synth. Coll. Vol. I, 78, 1941.

#### 4.2 Procedures for the Preparation of 5,6-Dihydropyrone Derivatives

##### General Method 1.

Methyl acetoacetate was added dropwise to a slurry of hexane washed sodium hydride in anhydrous tetrahydrofuran at 0 °C and the reaction stirred at 0 °C (15 minutes to 1 hour). n-Butyl lithium was then added at 0 °C and the reaction stirred at 0 °C (15 minutes to 1 hour). The aldehyde or ketone, in tetrahydrofuran, was added to the dianion and the reaction stirred at 0 °C (15 minutes to 24 hours) and allowed to warm to room temperature (15 minutes to 24 hours). To the reaction mixture was added water and the mixture allowed to stir 15 minutes to overnight. After extracting with diethyl ether, the aqueous layer at 0 °C was acidified with acid(2-6N HCl) to pH 1-2 and the aqueous layer extracted with ethyl acetate or CH<sub>2</sub>Cl<sub>2</sub>. The organic extracts of the acid solution were combined, dried over MgSO<sub>4</sub>, and concentrated.

Example A.

**5,6-Dihydro-4-hydroxy-6-phenyl-2H-pyran-2-one (±)**

The title compound was prepared as described in General Method 1 using 13.67 g methyl acetoacetate, 8.5 g of NaH 60% dispersion in oil, 73.6 mL of 1.6 M n-butyl lithium in hexane, 10 g of benzaldehyde, and 300 mL of tetrahydrofuran. After addition of the aldehyde, the reaction was stirred 15 minutes at -78 °C then allowed to warm to room temperature overnight. A solid was filtered off after concentration (m.p. 145-146 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.8-3.05 (m, 2 H), 3.5 (d, 1 H), 3.7 (d, 1 H), 5.7 (dd, 1 H), 7.3-7.5 (m, 5 H).

**Example B.**

**5,6-Dihydro-4-hydroxy-6-(2-methylpropyl)-6-phenyl-2H-pyran-2-one (±)**

The title compound was prepared as described in General Method 1 using 12 g methyl acetoacetate, 4.3 g of NaH 60% dispersion in oil, 64.5 mL of 1.6M n-butyl lithium in hexane, 10 g of iso-valerophenone, and 300 mL of tetrahydrofuran. After addition of the phenone, the reaction was stirred 15 minutes at -78 °C and 2 hours at room temperature. The crude reaction was flash chromatographed using hexane/ethyl acetate 6/40-40/60 as eluent. The solid was triturated from diethyl ether (m.p. 123.5-125 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 0.81 (d, 3 H), 0.89 (d, 3 H), 1.6-1.7 (M, 1 H), 1.91 (m, 2 H), 2.90 (d, 1 H), 2.95 (d, 1 H), 3.25 (d, 1 H), 3.35 (d, 1 H), 7.25-7.45 (m, 5 H).

**Example C.**

**5,6-Dihydro-4-hydroxy-6-(4-methoxyphenyl)-2H-pyran-2-one, (±)**

The title compound was prepared as described in General Method 1 using 5 mL of methyl acetoacetate, 2.0 g of NaH 60% dispersion in oil, 25 mL of 2.0 M n-butyl lithium in hexane, 7.0 mL of 4-methoxybenzaldehyde and 150 mL of tetrahydrofuran. After addition of the aldehyde, the reaction was stirred for 15 minutes at 0 °C then allowed to warm to room temperature overnight. The crude product was triturated from diethyl ether to afford a solid (m.p. 159-162 °C (dec.)). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.91 (dd, 2 H), 3.57 (dd, 2 H), 3.83 (s, 3 H), 5.66 (dd, 1 H), 6.93-6.97 (m, 2 H), 7.30-7.34 (m, 2 H).

**30 Example D.**

**5,6-Dihydro-4-hydroxy-6-[4-(methylthio)phenyl]-2H-pyran-2-one, (±)**

The title compound was prepared as described in General Method 1 using 10 mL of methyl acetoacetate, 4.0 g of NaH 60% dispersion in oil, 60 mL of 1.6 M n-butyl lithium in hexane, 18.8 mL of 4-methylthiobenzaldehyde and 200 mL of tetrahydrofuran. After addition of the aldehyde, the reaction

was stirred for 15 minutes at 0 °C then allowed to warm to room temperature overnight. The crude product was triturated from diethyl ether to afford a solid (m.p. 139-141 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.51 (s, 3 H), 2.92 (dd, 2 H), 3.58 (dd, 2 H), 5 5.68 (dd, 1 H), 7.27-7.31 (m, 4 H).

**Example E**

**5,6-Dihydro-4-hydroxy-6-(4-methylphenyl)-2H-pyran-2-one, (±)**

The title compound was prepared as described in General 10 Method 1 using 10 mL of methyl acetoacetate, 3.7 g of NaH 60% dispersion in oil, 58 mL of 1.6 M n-butyl lithium in hexane, 10.9 mL of p-tolualdehyde and 250 mL of tetrahydrofuran.

After addition of the aldehyde, the reaction was stirred for 15 minutes at 0 °C then allowed to warm to room temperature 15 overnight. The crude product was triturated from diethyl ether to afford a solid (m.p. 138-139 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.39 (s, 3 H), 2.93 (dd, 2 H), 3.58 (dd, 2 H), 5.69 (dd, 1 H), 7.23-7.31 (m, 4 H).

**20 Example F.**

**6-[4-(1,1-Dimethylethyl)phenyl]-5,6-dihydro-4-hydroxy-2H-pyran-2-one, (±)**

The title compound was prepared as described in General Method 1 using 5.0 mL of methyl acetoacetate, 2.0 g of NaH 60% dispersion in oil, 31.5 mL of 1.6 M n-butyl lithium in hexane, 25 9.0 g of 4-(1,1-dimethylethyl)benzaldehyde and 100 mL of tetrahydrofuran. After addition of the aldehyde, the reaction was stirred for 15 minutes at 0 °C then allowed to warm to room temperature overnight. The crude product was triturated 30 from diethyl ether to afford a solid (m.p. 164-165 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.33 (s, 9 H), 2.94 (dd, 2 H), 3.59 (dd, 2 H), 5.69 (dd, 1 H), 7.31-7.47 (m, 4 H).

dispersion in oil, 58 mL of 1.6 M n-butyl lithium in hexane, 13.5 g of 4-chlorobenzaldehyde and 250 mL of tetrahydrofuran. After addition of the aldehyde, the reaction was stirred for 15 minutes at 0 °C then allowed to warm to room temperature 5 overnight. The crude product was triturated from diethyl ether to afford a solid (m.p. 149-150 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.83 (dd, 1 H), 2.95 (dd, 1 H), 3.60 (dd, 2 H), 5.67 (dd, 1 H), 7.33-7.44 (m, 4 H).

**10 Example H.**

**6-(3-Chlorophenyl)-5,6-dihydro-4-hydroxy-2H-pyran-2-one, (±)**

The title compound was prepared as described in General Method 1 using 5.0 mL of methyl acetoacetate, 2.0 g of NaH 60% dispersion in oil, 25 mL of 2.0 M n-butyl lithium in hexane, 15 6.5 mL of 3-chlorobenzaldehyde and 150 mL of tetrahydrofuran. After addition of the aldehyde, the reaction was stirred for 15 minutes at 0 °C then allowed to warm to room temperature overnight. The crude product was triturated from diethyl ether to afford a solid (m.p. 122-124 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 20 2.83 (dd, 1 H), 2.96 (dd, 1 H), 3.60 (dd, 2 H), 5.68 (dd, 1 H), 7.25-7.42 (m, 4 H).

**Example I**

**5,6-Dihydro-4-hydroxy-6-[4-(phenylmethoxy)phenyl]-2H-pyran-2-one, (±)**

The title compound was prepared as described in General Method 1 using 5.0 mL of methyl acetoacetate, 2.0 g of NaH 60% dispersion in oil, 25 mL of 2.0 M n-butyl lithium in hexane, 12.0 g of 4-benzyloxybenzaldehyde and 150 mL of 30 tetrahydrofuran. After addition of the aldehyde, the reaction was stirred for 15 minutes at 0 °C then allowed to warm to room temperature overnight. The crude product was triturated from diethyl ether to afford a solid (m.p. 165-166 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.91 (dd, 2 H), 3.56 (dd, 2 H), 5.09 (s, 2 H), 35 5.65 (dd, 1 H), 6.98-7.04 (m, 2 H), 7.30-7.44 (m, 7 H).

**5,6-Dihydro-6-phenyl-6-(2-phenylethyl)-2H-pyran-2-one, (+/-)**

The title compound was prepared as described in General 15 Method 1 using 25 mmol of methyl acetoacetate, 27.5 mmol of NaH 60% dispersion in oil, 26.25 mmol of 1.6 M n-butyyl lithium in hexane, 25 mmol of 3-phenylpropiophenone and 70 mL of tetrahydrofuran. Upon concentrating the reaction a solid precipitated out which was triturated with ether and filtered 20 (m.p. 130-130.55, °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.2-2.4 (m, 2 H), 2.4-2.6 (m, 1 H), 2.6-2.8 (m, 1 H), 2.9 (d, 1 H), 3.0 (d, 1 H), 3.3 (d, 1 H), 3.4 (d, 1 H), 7.0-7.5 (m, 15 H).

**EXAMPLE Y.**

**25 5,6-Dihydro-4-hydroxy-6-phenyl-2(1H)-pyridinone (†)**

The title compound was prepared by decarboxylation of methyl 6-phenyl-2-,4-dioxopiperidine-3-carboxylate (prepared as per Ashton et al., *Heterocycles* 28: (2) 1015 (1989)) by refluxing in acetonitrile (as per Toda et al., *J. Antibiotics* 30 23: (2) 173 (1980)). Removal of the solvent gave a solid (m.p. 166-169 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.77 (dd, 1 H), 2.90 (dd, 1 H), 3.38 (s, 2 H), 4.80 (dd, 1 H), 6.40 (s, 1 H), 7.32-7.46 (m, 5 H).

**5,6-Dihydro-4-hydroxy-6-phenoxyethyl-6-phenyl-2H-pyran-2-one, (+/-)**

- 50 -

The title compound was prepared as described in General Method 1 using 0.85 mL of methyl acetoacetate, 350 mg of NaH 60% dispersion in oil, 5 mL of 1.6 M n-butyl lithium in hexane, 2.0 g of 2-phenoxy-1-phenyl ethanone and 60 mL of 5 tetrahydrofuran. After addition of the ketone, the reaction was stirred for 15 minutes at 0°C then allowed to warm to room temperature and stirred for 1 hour. The crude product was triturated from diethyl ether to afford a solid (m.p. 133-135 °C). <sup>1</sup>H NMR (DMSO-d<sub>6</sub>) δ 3.03 (d, 1 H), 3.35 (d, 1 H), 4.18 10 (dd, 2 H), 4.90 (s, 1 H), 6.92-6.95 (m, 3 H), 7.24-7.49 (m, 7 H), 11.56 (s, 1 H).

**Example A1**

**6-(2-Benzo[1,3]dioxol-5-yl-ethyl)-5,6-dihydro-4-hydroxy-6-15 phenyl-2H-pyran-2-one, (+/-)**

The title compound was prepared as described in General Method 1 using 0.22 mL of methyl acetoacetate, 90 mg of NaH 60% dispersion in oil, 1 mL of 2.1 M n-butyl lithium in hexane, 500 mg of 3-(3,4-methylenedioxyphenyl)propiophenone 20 and 15 mL of tetrahydrofuran. After addition of the ketone, the reaction was stirred for 15 minutes at 0°C then allowed to warm to room temperature and stirred for 2 hours. The crude product was triturated from diethyl ether to afford a solid (m.p. 112-114 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.20-2.28 (m, 2 H), 2.37-2.44 (m, 1 H), 2.61-2.69 (m, 1 H), 2.95 (dd, 2 H), 3.32 25 (dd, 2 H), 5.90 (s, 2 H), 6.52-6.70 (m, 3 H), 7.33-7.44 (m, 5 H).

#### General Method 2

The thiosylate reagents were prepared by reacting equal molar quantities of alkyl halide and potassium thiosylate in absolute ethanol and refluxing for 24 hours or in DMF and stirring at room temperature for 12 to 72 hours. The solvent 20 was stripped off and the residue was taken up in ethyl acetate and washed with water. Alternatively, water was added and the aqueous layer was extracted with diethyl ether or ethyl acetate. The organic extracts were dried over MgSO<sub>4</sub> and concentrated in vacuo.

25 Alternatively, the thiosylate reagents were prepared as described by M. G. Ranasinghe and P. L. Fuchs in *Syn. Comm.* 18(3): 227 (1988).

#### Example AA. Benzyl-p-toluenethiosulfonate

30 The title compound was prepared as described in General Method 2 using 0.05 mol of benzyl chloride, 0.05 moles of potassium thiosylate in 150 mL of ethanol. The residue was dissolved in hexane and seeded with a crystal of the product to afford 10.8 g (77%) of benzyl-p-toluenethiosulfonate (m.p. 35 52-56.5 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.45 (s, 3 H), 4.26 (s, 2 H), 7.18-7.30 (m, 7 H), 7.74 (d, 2 H).

**Example BB. 2-Phenylethyl-p-toluenethiosulfonate**

The title compound was prepared according to General Method 2 using phenethyl bromide (0.088 mmol), potassium thiotosylate (0.088 mol), and absolute ethanol (250 mL). A clear liquid was obtained which was used without purification.  
<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.47 (s, 3 H), 2.92 (t, 2 H), 3.24 (t, 2 H), 7.1-7.4 (m, 7 H), 7.84 (d, 2 H).

**Example CC. 3-Phenylpropyl-p-toluenethiosulfonate**

The title compound was prepared as described in General Method 2 using 1-bromo-3-phenylpropane (0.044 mmol), potassium thiotosylate (0.044 mmol) and absolute ethanol (125 mL) to give an oil which was used without purification. <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.95 (quint., 2 H), 2.459 (s, 3 H), 2.63 (t, 2 H), 2.95 (t, 2 H), 7.0-7.4 (m, 8 H), 7.7 (d, 2 H).

**Example DD. 2-Phenoxyethyl-p-toluenethiosulfonate**

The title compound was prepared as described in General Method 2 using 2-phenoxyethyl bromide (0.025 mmol), potassium thiotosylate (0.025 mmol) and DMF (100 mL) to give a solid.  
<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.45 (s, 3 H), 3.34 (t, 2 H), 4.14 (t, 2 H), 6.80 (d, 2 H), 6.95 (t, 1 H), 7.26 (t, 2 H), 7.35 (d, 2 H), 7.82 (d, 2 H).

**General Method 3**

The 3-bromo-5,6-dihydro-4-hydroxy-2H-pyran-2-one intermediates were prepared by reacting equimolar amounts of the requisite 6-substituted 5,6-dihydro-4-hydroxy-2H-pyran-2-ones (prepared in General Method 1) with N-bromosuccinimide (1.0 equiv.) in dry t-butanol in the dark. The solvent was evaporated, and the residue was partitioned between chloroform and water. The organic layer was washed with brine, dried (MgSO<sub>4</sub>), and concentrated.

**Example AAA. 3-Bromo-5,6-dihydro-4-hydroxy-6,6-diphenyl-2H-pyran-2-one**

The title compound was prepared as described in General Method 3 using 4.0 mmol of 5,6-dihydro-4-hydroxy-6,6-

- 58 -

diphenyl-2H-pyran-2-one (prepared in Example W) and 4.0 mmol of NBS. The product was obtained as a solid.  $^1\text{H}$  NMR (DMSO-d<sub>6</sub>)  $\delta$  3.68 (s, 2 H), 7.27-7.40 (m, 10 H).

**5 Example BBB. 3-Bromo-5,6-dihydro-4-hydroxy-6-phenyl-6-(2-phenylethyl)-2H-pyran-2-one, (+/-)**

The title compound was prepared as described in General Method 3 using 2.0 mmol of 5,6-dihydro-4-hydroxy-6-phenyl-6-(2-phenylethyl)-2H-pyran-2-one (prepared in Example X) and 2.0 mmol of NBS.  $^1\text{H}$  NMR (DMSO-d<sub>6</sub>)  $\delta$  2.16-2.58 (m, 4 H), 3.30 (m, 2 H), 7.04-7.60 (m, 10 H).

**Example CCC. 3-Bromo-5,6-dihydro-4-hydroxy-(3-methylbutyl)-6-phenyl-2H-pyran-2-one, (+/-)**

**15** The title compound was prepared as described in General Method 3 using 2.0 mmol of 5,6-dihydro-4-hydroxy-6-(3-methylbutyl)-6-phenyl-2H-pyran-2-one (prepared in Example V) and 2.0 mmol of NBS.  $^1\text{H}$  NMR (DMSO-d<sub>6</sub>)  $\delta$  0.80 (m, 6 H), 1.00 (m, 1 H), 1.14 (m, 1 H), 1.42 (m, 1 H), 1.95 (m, 2 H), 3.35 (m, 2 H), 7.25-7.52 (m, 5 H).

**Example DDD. 5-[5-Bromo-4-hydroxy-6-oxo-2-phenyl-3,6-dihydro-2H-pyran-2-yl]pentanoic acid, (+/-)**

The title compound was prepared as described in General Method 3 using 1.4 mmol of 5-[4-hydroxy-6-oxo-2-phenyl-3,6-dihydro-2H-pyran-2-yl]pentanoic acid (prepared in Example J1) and 1.4 mmol of NBS.  $^1\text{H}$  NMR (DMSO-d<sub>6</sub>)  $\delta$  0.94 (m, 1 H), 1.22-1.40 (m, 3 H), 1.92 (m, 2 H), 2.13 (t, 2 H), 3.28 (q, 2 H), 7.16-7.52 (m, 5 H).

**30**

**General Method 4**

The desired compounds were prepared by adding the 5,6-dihydro-2H-pyran-2-one, absolute ethanol, the p-toluenethiosulfonate reagent, and Et<sub>3</sub>N to a reaction vessel. The solution was stirred at room temperature to reflux for 4 hours to one week.

- 59 -

The solvent was stripped off and the residue partitioned between 1N HCl and CH<sub>2</sub>Cl<sub>2</sub>, or ethyl acetate. The layers were separated and the aqueous layer was extracted with CH<sub>2</sub>Cl<sub>2</sub>, or ethyl acetate. The organic layers were combined and dried 5 over MgSO<sub>4</sub>.

**Example 1.**

**5,6-Dihydro-4-hydroxy-6-phenyl-3-[ (phenylmethyl)thio]-2H-pyran-2-one (±).**

10 The title compound was prepared as described in General Method 4 using 2.1 mmol of 5,6-dihydro-4-hydroxy-6-phenyl-2H-pyran-2-one, 10 mL of absolute EtOH, 2.3 mmol of benzyl-p-toluenethiosulfonate and 2.3 mmol of Et<sub>3</sub>N in 5 mL of absolute EtOH. The solution was stirred for 3 days at room 15 temperature. Concentration in vacuo gave a solid which was broken up and made into a slurry in diethyl ether and ethyl acetate. The solid was filtered off and the mother liquors were concentrated and flash chromatographed on silica gel using CH<sub>2</sub>Cl<sub>2</sub>/MeOH (99/1 to 97/3) as eluants. The combined 20 crops gave 0.365 g (55%) of the desired product as a solid (m.p. 150-151.5 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.65 (dd, 1 H), 2.78 (dd, 1 H), 3.85 (d, 1 H), 3.94 (d, 1 H), 5.29 (dd, 1 H), 7.2-7.4 (m, 11 H).

The reaction was heated for 2 hours at 50 °C. The solid product was flash chromatographed using CH<sub>2</sub>Cl<sub>2</sub>/MeOH (99/1-98/2) to afford a solid (m.p. 47-49 °C). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.5-1.8 (m, 2 H), 1.9-2.1 (m, 2 H), 2.3 (ABq, 2 H), 2.84/2.91 (s/s 3 H), 2.98-3.02 (m, 2 H), 3.5 (dd, 1 H), 3.7 (dd, 1 H), 4.46/4.55 (s/s, 2 H), 6.8-6.9 (m, 2 H), 7.0-7.5 (m, 13 H).

**General Method 5.**

The desired compounds were prepared by adding the appropriate acid chloride (1.05 equiv.) to a solution of the 5,6-dihydro-2H-pyran-2-one (1.0 equiv.), triethylamine (1.05 equiv.), and THF at 5 °C. The suspension was stirred overnight at room temperature and then diluted with ethyl acetate and water. The organic phase was washed with ice-cold 1 N HCl and brine, dried over MgSO<sub>4</sub>, and concentrated. The residue was dissolved in toluene, treated with catalytic DMAP, and heated at 80-85 °C for 4 to 8 hours. The solution was cooled to room temperature and diluted with water. The organic phase was washed with ice-cold 1 N HCl and brine, dried (MgSO<sub>4</sub>), and concentrated. The product was chromatographed on silica gel, eluting with 5:1 hexane:ethyl acetate, to give the 3-acylated intermediate. This material was dissolved in glacial acetic acid, treated with sodium cyanoborohydride (2 equiv), and stirred at room temperature for two hours. The reaction mixture was diluted with water, acidified with conc. HCl, and extracted with ethyl acetate. The extract was washed with

The title compound was prepared as described in General Method 5 using 2.0 mmol of 5,6-dihydro-4-hydroxy-6,6-diphenyl-2H-pyran-2-one, 2.1 mmol of phenylacetyl chloride, 2.1 mmol of 10 triethylamine, and 10 mL of THF, followed by 10 mL of toluene and catalytic DMAP. Chromatography of the residue afforded 1.5 mmol of the intermediate 3-acyl compound. Reduction of this acyl derivative was accomplished with 3 mmol of sodium cyanoborohydride. The product was triturated from ether (m.p. 15 158-159 °C).  $^1H$  NMR ( $DMSO-d_6$ )  $\delta$  2.31 (m, 4 H), 3.37 (m, 2 H), 6.93 (d, 1 H), 7.07-7.17 (m, 3 H), 7.24-7.28 (m, 2 H), 7.35 (m, 8 H).

Alternatively, the title compound could be prepared as follows. A suspension of 0.25 g (6.2 mmol) of sodium hydride 20 in 5 mL of dry THF was cooled to 0°C under nitrogen and treated with a solution of 1.40 g (6.0 mmol) of ethyl 2-(2-phenylethyl)acetooacetate in THF (2 mL). The solution was stirred at 0°C for ten minutes, treated with 4.3 mL of 1.4 M n-butyllithium, and stirred for another fifteen minutes. A 25 solution of 0.55 g (3.0 mmol) of benzophenone in THF (3 mL) was added all at once, and the reaction mixture was stirred at room temperature for two hours. Water (75 mL) was added, and the mixture was stirred overnight at room temperature. The solution was washed with ether. The aqueous layer was 30 acidified to pH 2 with 6 N HCl and extracted with ethyl acetate; the extract was washed with brine, dried over magnesium sulfate, and concentrated. The residue was triturated with ether : hexane 1:1, and the solids were filtered and dried to give the title compound.

The title compound was prepared as described in General Method 6 from 2.0 mmol of 3-bromo-5,6-dihydro-4-hydroxy-6-phenyl-6-(2-phenylethyl)-2H-pyran-2-one (prepared in example BBB), 2.1 mmol of 4-methyl-2-isopropylbenzenethiol, and 2.1 mmol of piperidine in 30 mL of dichloromethane. The product was chromatographed on silica gel, eluting first with chloroform and then with 5% methanol in chloroform (m.p. 75-76 °C). <sup>1</sup>H NMR (DMSO-d<sub>6</sub>) δ 1.15 (m, 6 H), 2.16 (s, 3 H), 2.19-2.36 (m, 3 H), 2.62 (m, 1 H), 3.21 (m, 1 H), 3.44 (q, 2 H), 5.82 (d, 1 H), 6.40 (dd, 1 H), 6.95 (d, 1 H), 7.10-7.18 (m, 3 H), 7.25 (m, 2 H), 7.44 (m, 5 H).

20 Example 88

**Methyl 2-[[5,6-dihydro-4-hydroxy-2-oxo-6-(2-phenylethyl)-6-phenyl-2H-pyran-3-yl]thio]benzoate (+/-)**

The title compound was prepared as described in General Method 6 from 1.9 mmol of 3-bromo-5,6-dihydro-4-hydroxy-6-phenyl-6-(2-phenylethyl)-2H-pyran-2-one (prepared in example BBB), 2.2 mmol of methyl thiosalicylate and 2.1 mmol of piperidine in 30 mL of dichloromethane. The crude product was chromatographed on silica gel, eluting first with chloroform and then with 5% methanol in chloroform, to give the title compound (m.p. 91-92 °C). <sup>1</sup>H NMR (DMSO-d<sub>6</sub>) δ 2.25 (m, 2 H), 2.38 (m, 1 H), 2.62 (m, 1 H), 3.44 (q, 2 H), 3.82 (s, 3 H), 6.06 (bd, 1 H), 6.90 (t, 1 H), 7.05-7.52 (m, 11 H), 7.81 (dd, 1 H).

35 General Method 7

The desired compounds were prepared by adding the 5,6-dihydriopyrano-2H-pyran-2-one, absolute ethanol, the p-

toluenethiosulfonate reagent (prepared in general method 2), sodium bicarbonate, and Et<sub>3</sub>N to a reaction vessel. The mixture was then subsequently heated to 40 °C for 4 to 48 h. The mixture was then diluted with H<sub>2</sub>O, acidified with conc. HCl, 5 and the product extracted with diethyl ether, CH<sub>2</sub>Cl<sub>2</sub>, or ethyl acetate. The organic layers were combined and dried with Na<sub>2</sub>SO<sub>4</sub>.

**General Method 8**

The desired compounds were prepared by adding the 5,6-dihydro-2H-pyran-2-one and dry dichloromethane to a reaction vessel followed by the addition of the acid chloride and Et<sub>3</sub>N. 35 The mixture was allowed to stir for 15 min. and then diluted with diethyl ether. The mixture was then washed with sat'd NaHCO<sub>3</sub> (2x) and the organic layer dried with MgSO<sub>4</sub>. The solvent

was then removed in vacuo, the residue redissolved in CH<sub>3</sub>CN and then treated with Et<sub>3</sub>N and acetone cyanohydrin. The mixture was allowed to stir for 18 h and then diluted with diethyl ether. The mixture was then washed with 1.0 N HCl, dried with Na<sub>2</sub>SO<sub>4</sub>, 5 and the solvent removed in vacuo. The residue was then dissolved in glacial acetic acid and treated with NaBH<sub>3</sub>CN. The reaction was allowed to proceed for 30 min then treated with brine. The mixture was then extracted with ethyl acetate, the organic layers combined, dried with MgSO<sub>4</sub>, and the solvent 10 removed in vacuo.

**Example 132**

**4-Hydroxy-3-[(1-isopropyl-1,4,5,6-tetrahydro-pyrimidine-2-yl)thio]-6-phenyl-5,6-dihydro-2H-pyran-2-one.**

The title compound was prepared as described in example 41 using the following: 5,6-dihydro-4-hydroxy-6-phenyl-6-(2-phenylethyl)-2H-pyran-2-one (0.250 g, 0.850 mmol), t-butanol (3.5 mL), n-bromosuccinimide (0.151 g, 0.85 mmol), CH<sub>2</sub>Cl<sub>2</sub> (6.0 mL), 1-isopropyltetrahydropyrimidine-2-thione (0.270 g, 1.70 mmol, prepared by the method described by A.F. McKay et al., *J. Am. Chem. Soc.*, 78: 1618 (1956)), piperidine (0.084 mL, 0.85 mmol). Purification was achieved by submitting the final residue to column chromatography (SiO<sub>2</sub>, 1/1 CH<sub>2</sub>Cl<sub>2</sub>/ethyl acetate to 2/14/1 ethyl acetate/CH<sub>2</sub>Cl<sub>2</sub>/methanol) to provide a solid which was redissolved in CH<sub>2</sub>Cl<sub>2</sub>, filtered through a fiberglass filter, and the solvent removed in vacuo to provide the title compound (0.356 g, m.p. 103 - 105°C). <sup>1</sup>H NMR (400 MHz, DMSO-d<sub>6</sub>) δ 7.440 - 7.371 (m, 4 H), 7.296 (t, 1 H, J = 7 Hz), 7.233 (t, 2 H, J = 7 Hz), 7.139 (t, 1 H, J = 7 Hz), 7.077 (d, 2 H, J = 7 Hz), 6.515 (bs, 1 H), 4.365 - 4.300 (m, 1 H), 3.335 - 3.308 (m, 2 H), 3.024 - 2.924 (m, 4 H), 2.624 - 2.548 (m, 1 H), 2.341 - 2.265 (m, 1 H), 2.156 - 2.061 (m, 2 H), 1.763 - 1.737 (m, 2 H), 1.201 - 1.180 (m, 6 H).

**Example 133**

35 **6-(2-Benzo[1,3]dioxol-5-yl-ethyl)-5,6-dihydro-4-hydroxy-6-phenyl-3-[(2-isopropyl-5-methyl-phenylthio)-2H-pyran-2-one(+/-)],**

- 121 -

The title compound was prepared as described in General Method iii using 400 mg of 6-(2-benzo[1,3]dioxol-5-yl-ethyl)-5,6-dihydro-4-hydroxy-6-phenyl-2H-pyran-2-one, 415 mg of toluene-4-thiosulfonic acid S-(2-isopropyl-5-methylphenyl) ester 5 and 0.17 ml of triethylamine in 20 ml of absolute ethanol. The solution was stirred overnight at room temperature. Purification by flash chromatography using hexanes/isopropanol (90/10 to 50/50) as eluent gave a solid (mp=83-85 °C) <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.21 (d, 3H), 1.25 (d, 3H), 1.93 (s, 3H), 2.20-2.40 10 (m, 3H), 2.60-2.75 (m, 1H), 3.30 (dd, 2H), 3.42 (q, 1H), 5.89 (s, 2H), 6.11 (s, 1H), 6.52 (d, 1H), 6.56 (s, 1H), 6.69 (d, 1H), 6.87 (d, 1H), 7.07 (d, 1H), 7.30-7.50 (m, 5H), 7.64 (br.s, 1H).

#### 4.3 Determination of HIV Protease Inhibition

##### 4.3.1 Starting Materials

DTT Buffer: 1.0 mM dithiothreitol (DTT) was prepared fresh daily in 0.1% polyethylene glycol (mw 8000) 80 mM NaOAc, 160 mM 20 NaCl, 1.0 mM EDTA, and brought to pH 4.7 with HCl.

HIV-1 Protease: The enzyme is obtained from Bachem Bioscience Inc. The undiluted enzyme is thawed from -80 °C and diluted 50-fold with DTT buffer. The solution is always kept at 0 °C on ice water and used in the experiment within 20 minutes after 25 thawing.

Enzyme Substrate: Substrate III from Bachem Bioscience Inc. is the undecapeptide H-His-Lys-Ala-Arg-Val-Leu-p-Nitrophenylalanine-Glu-Ala-Norleucine-Ser-NH<sub>2</sub> (>97% purity). A 200 μM stock solution in DTT buffer is prepared and stored on 30 ice. Substrate solution is prepared fresh daily.

Test Compound: 10 mM inhibitor (I) in dimethyl sulfoxide (DMSO) is diluted to 200 μM with DTT buffer. From the 200 μM stock solution is made a 10 μM stock solution with 2% DMSO in DTT buffer. The two inhibitor solutions are used to make final [I] 35 = 100, 50, 20, 10, 5, 2, 1, 0.5 and 0 μM with 2% DMSO in DTT buffer in each reaction well (total inhibitor volume of 50 μl).

- 122 -

#### 4.3.2 Assay

To each reaction well is added 20  $\mu$ l of substrate (final concentration of 40  $\mu$ M), 50  $\mu$ l of inhibitor (at a concentration such that final dilution will produce the test concentration) 5 and 20  $\mu$ l of DTT buffer. The reaction plate (96 wells) is incubated at 37 °C for at least 5 minutes.

10  $\mu$ l of the diluted protease is added to the reaction well while the reaction plate is shaking. Once shaken for 10 seconds, the plate is returned to the heating block at 37 °C. 10 (final reaction volume 100  $\mu$ l.)

The reaction is incubated for 5 minutes at 37 °C. The reaction is stopped by placing the reaction plate on the shaker and adding 20  $\mu$ l of 10% trifluoroacetic acid (TFA) and shaking for 10 seconds. The amount of proteolysis is then determined by 15 separation of noncleaved substrate and two cleaved products with reverse-phase HPLC, while measuring absorbance at 220 nm to determine the relative peak areas of the three components. The relative peak areas are used to calculate % conversion to product as a function of inhibitor concentration. The data are 20 plotted as % Control (the ratio of % conversion in the presence and absence of inhibitor  $\times$  100) versus inhibitor concentration and fitted with the equation  $Y=100/1+(X/IC_{50})^A$ , where  $IC_{50}$  is the inhibitor concentration at 50% inhibition and A is the slope of the inhibition curve.

25 The results are listed in Table I.

Anti-HIV-1 Activity

25     Using the general methods of Pauwels et al., (*J. Virol. Methods*, 16, 171-185, 1987) and Mann et al. (*AIDS Research and Human Retroviruses*, 253-255, 1989 (anti-viral assays of active HIV-1 infection were performed in  
 30     the H9 cell line. Cultures were batch infected in 1 ml of RPMI 1640 media/10% fetal calf serum containing  $10^5$  infectious doses of HIV1<sub>MLB</sub> for an effective multiplicity of infection of 0.01. After 2 hours of viral absorption, cells were washed once and plated in 96-well microtiter plates at a density of  $10^4$  cells per well.  
 35     Test compounds were added to produce the desired concentration of drug and 0.1% DMSO in a final volume of

- 124 -

200  $\mu$ l. Uninfected parallel cultures were maintained for XTT cytotoxicity assay at 7 days post infection. Cultures were tested for viral replication by reverse transcriptase assay at 4 and 7 days post infection.

- \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*O\* document referring to an oral disclosure, use, exhibition or other means
- \*P\* document published prior to the international filing date but later than the priority date claimed

- \*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- \*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- \*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- \*&\* document member of the same patent family

7. A compound of the formula of claim 6 selected from the group consisting of
- 5,6-Dihydro-4-hydroxy-6-phenyl-6-(2-phenylethyl)-3-[ [3-(phenylmethoxy)phenyl]methyl]-2H-pyran-2-one;
- 5 5,6-Dihydro-4-hydroxy-6-(3-methylbutyl)-3-[5-methyl-1-(phenylmethyl)hexyl]-6-phenyl-2H-pyran-2-one;
- 10 3-[1-(Cyclohexylthio)-5-methylhexyl]-5,6-dihydro-4-hydroxy-6-(3-methylbutyl)-6-phenyl-2H-pyran-2-one;
- 15 3-[2-Cyclohexyl-1-[(3-methylbutyl)amino]ethyl]-5,6-dihydro-4-hydroxy-6-(3-methylbutyl)-6-phenyl-2H-pyran-2-one;
- 20 5,6-Dihydro-4-hydroxy-3-[ (2-isopropyl-5-methylphenyl)methyl]-6-(2-phenylethyl)-6-phenyl-2H-pyran-2-one;
- 25 5,6-Dihydro-4-hydroxy-3-[ (3-hydroxymethyl-2-isopropyl-5-methylphenyl)methyl]-6,6-diphenyl-2H-pyran-2-one;
- 30 5 , 6 - D i h y d r o - 4 - h y d r o x y - 3 - [ [ 4 - (hydroxymethyl)phenyl]methyl]-6-pentyl-6-phenyl-2H-pyran-2-one;
